

PANÁK-ITE

DIRECTIONS FOR USE

FLOWERS AND VEGETABLE GARDENS -- For garden vegetables of finest quality and flowers of outstanding beauty, **one pound** of *PANÁK-ITE* to each **40 square feet** of soil will prove most effective (Same as lawns). Work *PANÁK-ITE* into the topsoil and water directly, sufficiently to saturate completely.

HOUSE PLANTS – Add between **one heaping teaspoon to two full tablespoons** of *PANÁK-ITE* depending on pot and plant size; mix carefully with potting soil. Apply water same day in normal amount.

LAWNS -- **One pound of *PANÁK-ITE* to each 40 square feet** of lawn. Newly seeded lawns--apply to top soil and rake in well over entire surface. Old lawns--apply *PANÁK-ITE* evenly, and sprinkle gently with water immediately after application to prevent wind dispersion.

SHRUBS, HEDGES and BUSHES -- Apply one ounce (**1 oz.**) of *PANÁK-ITE* to each **2.5 square feet** of topsoil, mix-in thoroughly as soon as possible.

TREES -- **First time application, or if sickly 50 lbs.** of *PANÁK-ITE* for each large or older tree is recommended. **20 to 25 lbs. is usually sufficient for young trees.** Apply in a circle trench 2-3' wide, at least 3" deep centered at the drip line of branches, and thoroughly mix with soil for best results. Water as usual. For healthy trees **subsequent application reduce quantity by 50% for next two years**, then apply this reduced amount only every other year thereafter, or less according the observed results in your particular soil.

LARGE ACREAGE / FARMS – **1000 lbs. per acre** if applied dry. *PANÁK-ITE* may also be liquefied prior to application for more rapid results.

PANÁK-ITE is an all natural product quarried in Lincoln County, Nevada just outside the township of Panaca. The formation has been known for years under various trade names, as a valuable soil conditioner and fertilizer booster. Documented testimonials spanning seven decades attest to the efficacy of adding chelated minerals in trace amounts in a clay medium to a conscientious fertilization and watering program. With many plant families results can be measured within just 2-3 weeks from application as directed. Remineralize your soil and tell us about your success with houseplants, lawns and golf courses, crops and vegetable gardens, fruit and nut trees, flowers, and hedges.

We are interested in your results. E-mail photos and your experience with *PANÁK-ITE* to joe@chelatedtraceminerals.com

Warning: Handling without gloves may cause noticeable dryness to the skin. Rinse hands thoroughly after gardening, and apply hand lotion as needed. Do not over-apply to crops. *PANÁK-ITE* is a natural diatomaceous sediment laced with lignitic silts. Its clay matrix (Montmorillonite) consists of ultra-fine, colloidal particles, trace minerals and organic matter. It may harden soil if overused without allowing sufficient time for plants to uptake its silicon content in-between harvests. If a little bit is good, a lot is not necessarily better. Results may vary substantially due to pH, your type of soil and its prior condition, as well as, altitude, general climate, and seasonal factors such as temperature extremes, and abnormal precipitation.
